

Tension/compression force transducer

With thin-film technology and swivel head to 45 kN [10,116 lbf]

Model F2303

WIKA data sheet FO 51.46

Applications

- Machine building and plant construction
- Manufacturing automation
- Presses, lifting cylinders, welding guns, drives
- Chemistry and petrochemistry

Special features

- Measuring ranges 0 ... 10 kN to 0 ... 45 kN
[0 ... 2,248 lbf to 0 ... 10,116 lbf]
- Corrosion-resistant stainless steel design
- Integrated amplifier
- High long-term stability, high shock and vibration resistance
- Good reproducibility, simple installation

Tension/compression force transducer, model F2303

Description

Tension/compression force transducers are designed for static and dynamic measurement tasks in the direct flux of force. They determine the tension and compression forces in a wide scope of applications.

Force transducers of this series are used for measuring axial forces on electric spindle presses, for monitoring overload protection in lifting cylinders and for measuring force on punches, presses and welding guns. Appropriate technical and regional approvals are available as an option.

These force transducers are made of high-strength, corrosion resistant stainless steel 1.4542, which is particularly suitable for their application areas. The standard active current and voltage outputs are available as output signals (4 ... 20 mA, 0 ... 10 V). Redundant output signals and CAN protocols are possible.

Specifications in accordance with VDI/VDE/DKD 2638

Model	F2303
Rated force F_{nom} kN	10, 18, 20, 34, 45
Rated force F_{nom} lbf	2,248; 4,047; 4,496; 7,644; 10,116
Relative linearity error $d_{lin}^{1)}$	0.5 % F_{nom}
Relative reversibility error	< 0.1 % F_{nom}
Relative creep, 30 min. at F_{nom}	0.1 % F_{nom}
Temperature effect on	
Zero signal TK0	0.4 % F_{nom} / 10 K
Characteristic value TK _C	0.4 % F_{nom} / 10 K
Limit force F_L	150 % F_{nom}
Breaking force F_B	300 % F_{nom}
Permissible vibration loading F_{rb}	±50 % F_{nom} (in accordance with DIN 50100)
Rated displacement (typical) s_{nom}	< 0.1 mm [< 0.004 in]
Material of the measuring body	Corrosion-resistant stainless steel 1.4542, ultrasound-tested 3,1 material (optionally 3,2)
Rated temperature range $B_{T, nom}$	-20 ... +80 °C [-4 ... +176 °F]
Service temperature range $B_{T, G}$	-30 ... +80 °C [-22 ... +176 °F]
Storage temperature range $B_{T, S}$	-40 ... +85 °C [-40 ... +185 °F]
Electrical connection	Circular connector M12 x 1, 4-pin
Output signal (Rated characteristic value) C_{nom}	<ul style="list-style-type: none"> ■ 4 ... 20 mA 2-wire ■ 4 ... 20 mA 3-wire ■ DC 0 ... 10 V 3-wire ■ Optional redundant signal ■ CANopen® Protocol in accordance with CiA 301, device profile 404, communication services LSS (CiA 305), configuration of the instrument address and baud rate Sync/Async, Node/Lifeguarding, heartbeat; zero and span ±10 % adjustable via entries in the object directory ²⁾
Current/power consumption	Current output: 4 ... 20 mA Signal current: 2-wire
Supply voltage U_B	DC 10 ... 30 V for current output
Load	≤ ($U_B - 10$ V)/0.024 A for current output
Response time	< 1 ms (within 10 % to 90 % F_{nom}) ³⁾
Ingress protection (per EN/IEC 60529)	IP67
Electrical protection	Reverse polarity protection, overvoltage and short-circuit resistance
Vibration resistance (per DIN EN 60068-2-6)	20 g, 100 h, 50 ... 150 Hz
Immunity	Per DIN EN 61326-1/DIN EN 61326-2-3 (optionally EMC-protected versions)
Options	Certificates, strength verifications, 3D/CAD files (STEP, IGES) on request

1) Relative linearity error is specified in accordance with Directive VDI/VDE/DKD 2638 Chap. 3.2.6.

2) Protocol in accordance with CiA 301, device profile 404, communication service LSS (CiA 305) / 3) Other response times possible upon request.

CANopen® and CiA® are registered community trademarks of CAN in Automation e. V.

Supply UB- (CAN GND)	3
Bus signal, CAN-High	4
Bus signal, CAN-Low	5

Circular connector M12 x 1, 5-pin

Connect the cable shield to the force transducer housing.

In the case of accessory cables, the cable shield must be connected with the knurled nut and thus connected to the housing of the force transducer. When extending, only shielded and low capacitance cables should be used. The permitted maximum and minimum lengths of the cable are specified in ISO 11898-2.

A high-quality connection of the shielding must also be ensured.

Short description of signal jump electronics

Amplifier electronics 4 ... 20 mA or 0 ... 10 V for signal jump applications with 2-channel PC control.

With these force transducers, four variable resistors (R1 ... R4) are connected together to form a Wheatstone bridge. When the measuring body deforms, the opposing resistors are stretched or compressed in the same way. This leads to a detuning of the bridge and a diagonal voltage U_0 .

The test resistor R7 is now important in connection with checking the subsequent amplifier circuit and the subsequent signal paths. This is switched parallel to the resistor R5 via the relay contact (a) as soon as the excitation voltage U_r of the relay A is present. The connection of the resistor R7 causes a defined, always constant, detuning of the zero point (diagonal voltage) of the Wheatstone bridge.

Compliance with functional safety

An external safety control system independent of the force transducer must monitor the safe functioning of the force transducer. The functional test with a signal jump of 4 mA / 2 V is executed at an interval of 24 hours. The safety control system activates the relay A, thus changing the output signal of the force transducer in a defined manner.

If the expected change in the output signal occurs, it can be assumed that the entire signal path from the Wheatstone bridge via the amplifier through to the output is functioning correctly. If this does not occur, then it can be concluded that there is a error in the signal path.

Moreover, the measuring signal should be checked by the safety control for the min. (A) and max. (B) signal value to ensure that any cable break or short-circuit that has occurred is detected.

The default setting of the force transducer with current output 4 ... 20 mA for overload detection is, for example:

With a fixed signal jump of, for example, 4 mA, the test cycle can then be triggered, in any operating state, by activating the test relay. The upper measuring range limit of 20 mA will

never be reached and thus the checking of the signal jump is enabled.
